fault tolerant computing has evolved into a broad discipline one that encompasses all aspects of reliable computer design diverse areas of fault tolerant study range from failure mechanisms in integrated circuits to the design of robust software fault tolerant computing is driven by a number of key factors including ultra high reliability reduced life cycle costs and long life applications this book is intended to be both introductory and suitable for advanced level graduates chapters can be selected in various combinations to provide courses with different orientations

from the preface pulse methods in 1d and 2d liquid phase nmr is written to enable the practicing nmr spectroscopist to understand and apply the varied and powerful new techniques developed in the past few years for obtaining spectra with greatly increased information content and from smaller and smaller samples the intent is to describe both theory and practice in simple and detailed fashion so that the methods may be critically evaluated and effectively used in any potential application as methods become more complex they require more instrument time and it is important to be able to judge

whether the investment of this time is justified it is also essential for the spectroscopist to be in a position to evaluate the capabilities of the instrumentation available as well as the additional requirements for utilization of particular new methods the material in this book assumes a knowledge of continuous wave nmr methods as well as an elementary understanding of the normal pulsed fourier transform spectroscopic procedures together with a knowledge of such related phenomena as the nuclear overhauser effect although much of the treatment is necessarily mathematical this aspect of the presentation has been simplified as much as possible
