biology is in the midst of a era yielding many significant discoveries and promising many more unique to this era is the exponential growth in the size of information packed databases inspired by a pressing need to analyze that data introduction to computational biology explores a new area of expertise that emerged from this fertile field the combination of biological and information sciences this introduction describes the mathematical structure of biological data especially from sequences and chromosomes after a brief survey of molecular biology it studies restriction maps of dna rough landmark maps of the underlying sequences and clones and clone maps it examines problems associated with reading dna sequences and comparing sequences to finding common patterns the author then considers that statistics of pattern counts in sequences rna secondary structure and the inference of evolutionary history of related sequences introduction to computational biology exposes the reader to the fascinating structure of biological data and explains how to treat related combinatorial and statistical problems written to describe mathematical formulation and development this book helps set the stage for even more truly interdisciplinary work in biology

the american educational history journal is a peer reviewed research journal examining educational topics from diverse disciplinary perspectives it promotes scholarly dialogue across backgrounds including political science history curriculum and teacher education

a study of the art and science of solving elliptic problems numerically with an emphasis on problems that have important scientific and engineering applications and that are solvable at moderate cost on computing machines

a numerical solution is presented for the laminar two dimensional viscous incompressible wake behind a finite flat plate the plate is infinitely thin and is aligned parallel to a uniform stream the reynolds number based on plate length is assumed large enough to allow the formation of boundary layers on the sides of the plate the upstream influence of the trailing edge disturbance necessitates solving the complete navier stokes equations in the trailing

edge region the aim of the investigation is to calculate an improved first approximation to the solution in this region for large values of the reynolds number the elliptic equations define a boundary value problem a finite difference solution to equations which closely approximate the navier stokes equations is obtained in a rectangular region which includes the trailing edge a relaxation type procedure is used weighted differences which combine backward and central differences in equal proportion are introduced to provide the upstream influence in the scheme the nonlinear partial differential equations are replaced by linear difference equations and iteration is used until the solutions converge solutions are obtained for reynolds numbers larger than 100 000 a complete description of the flow field is provided in the rectangle and downstream wake except in a very small region surrounding the trailing edge author

similarity solutions for moving wall two dimensional incompressible boundary layer equations are reviewed and extended with the objective of using them as a family of velocity profiles in an approximate nonsimilar integral technique modified author abstract
