s2the appalachian cooperative grouse research project acgrp was a multistate cooperative effort initiated in 1996 to investigate the apparent decline of ruffed grouse *bonasa umbellus* and improve management throughout the central and southern appalachian region i e parts of ohio pennsylvania rhode island kentucky west virginia virginia and north carolina usa researchers have offered several hypotheses to explain the low abundance of ruffed grouse in the region including low availability of early successional forests due to changes in land use additive harvest mortality low productivity and recruitment and nutritional stress as part of the acgrp we investigated ruffed grouse population ecology our objectives were to estimate reproductive rates estimate survival and cause specific mortality rates examine if ruffed grouse harvest in the appalachian region is compensatory and estimate ruffed grouse finite population growth we trapped 3 000 ruffed grouse in autumn sep nov and spring feb mar from 1996 to september 2002 on 12 study areas we determined the age and gender of each bird and fitted them with necklace style radiotransmitters and released them at the trap site we tracked ruffed grouse 2 times per week using handheld radiotelemetry equipment and gathered data on reproduction recruitment survival and mortality ruffed grouse population dynamics in the appalachian region differed from the central portion of the species range i e northern united states and canada ruffed grouse in the appalachian region had lower productivity and recruitment but higher survival than reported for populations in the great lakes region and southern canada population dynamics differed between oak *quercus* spp hickory *carya* spp and mixed mesophytic forest associations within the southern and central appalachian region productivity and recruitment were lower in oak hickory forests but adult survival was higher than in mixed mesophytic forests furthermore ruffed grouse productivity and recruitment were more strongly related to hard mast i e acorn production in oak hickory forests than in mixed mesophytic forests the leading cause of ruffed grouse mortality was avian predation 44 of known mortalities harvest mortality accounted for 12 of all known mortalities and appeared to be compensatory population models indicated ruffed grouse populations in the appalachian region are declining $\lambda = 0.78 \pm 0.95$ but differences in model estimates highlighted the need for improved understanding of annual productivity and recruitment we posit ruffed grouse in the appalachian region exhibit a clinal population structure characterized by changes in life history strategies changes in life

history strategies are in response to gradual changes in forest structure quality of food resources snowfall and accumulation patterns and predator communities management efforts should focus on creating a mosaic of forest stand ages across the landscape to intersperse habitat resources including nesting and brood cover adult escape cover roosting sites and most importantly food resources land managers can intersperse habitat resources through a combination of clearcutting shelterwood harvest group selection and timber stand improvement including various thinnings and prescribed fire managers should maintain current ruffed grouse harvest rates while providing high quality hunting opportunities we define high quality hunting as low hunting pressure low vehicle traffic and high flush rates managers can provide high quality hunting opportunities through use of road closures in conjunction with habitat management s3
