optimal design of experiments offers a rare blend of linear algebra convex analysis and statistics the optimal design for statistical experiments is first formulated as a concave matrix optimization problem using tools from convex analysis the problem is solved generally for a wide class of optimality criteria such as d a or e optimality the book then offers a complementary approach that calls for the study of the symmetry properties of the design problem exploiting such notions as matrix majorization and the

kiefer matrix ordering the results are illustrated with optimal designs for polynomial fit models bayes designs balanced incomplete block designs exchangeable designs on the cube rotatable designs on the sphere and many other examples

this book follows the previously published title solving large scale problems in mechanics edited by m papadrakakis this first volume to be published in the wiley series in solving large scale problems in mechanics is devoted to high performance computing using the new generation of computers with parallel and distributed computing capabilities parallel and distributed processing is a rapidly growing area of high technology where engineering applications lagged behind hardware advances new algorithms and codes are required in order to exploit effectively modern computer architectures as programs suitable for conventional computers achieve very modest performances on these new machines there is therefore an urgent need to develop and test powerful solution and data handling techniques capable of exploiting the potential of modern computers and of accomplishing the solution of complex engineering problems in an acceptable computing time this volume intends capturing the latest developments in the field and to serve as an essential reference book on the subject it comprises a comprehensive state of the art treatment of theory and practice illustrated by extensive numerical examples
