*the question whether and how boundaries might individuate and thereby be constitutive features of any imaginable legal order has yet to be addressed in a systematic and comprehensive manner by legal and political theory this book seeks to address this important omission providing an original contribution to the debate about law in a global setting against the widely endorsed assumption that we are now moving towards law without boundaries it argues that every imaginable legal order global or otherwise is bounded in space time membership and content the book is built up around three main insights firstly that legal orders can best be understood as a form of joint action in which authorities mediate and uphold who ought to do what where and when with a view to realising the normative point of acting together secondly that behaviour can call into question the boundaries that determine who ought to do what where and when a legality thirdly that this a legality reveals boundaries as marking a limit and to a lesser or greater extent a fault line of the respective legal order legal boundaries reveal ways of ordering the who what where and when of behaviour which have been excluded yet which remain within the range of practical possibilities accessible to the collective limits however legal boundaries also intimate an order which exceeds the range of possibilities accessible to that collective the fault line of the respective legal order careful analysis of a wide range of legal orders including nomadism roman law classical international law ius gentium multinationals cyberlaw lex mercatoria the eu global regimes of human rights and space law validates this thesis what sense then can we make of the normativity of the law if there can be no inclusion without exclusion arguing that legal and political theories misunderstand how legal boundaries do their work of including and excluding the book develops a normative theory of legal order which is alternative to both communitarianism and cosmopolitanism*

a key challenge in science and engineering is to provide a quantitative description of the systems under investigation leveraging the noisy data collected such a description may be a complete mathematical model or a mechanism to return controllers corresponding to new unseen inputs recent advances in the theories are described in detail along with their applications in engineering the book aims to develop model free system analysis and control strategies i.e. data driven control from theoretical analysis and engineering applications based only on measured data the study aims to develop system identification and combination in advanced control theory i.e. data driven control strategy as system and controller are generated from measured data directly the book reviews the development of system identification and its combination in advanced control theory i.e. data driven control strategy as they all depend on measured data firstly data driven identification is developed for the closed loop nonlinear system and model validation i.e. obtaining model descriptions from measured data secondly the data driven idea is combined with some control strategies to be considered data driven control strategies such as data driven model predictive control data driven iterative tuning control and data driven subspace predictive control thirdly data driven identification and data driven control strategies are applied to interested engineering in this context the book provides algorithms to perform state estimation of dynamical systems from noisy data and some convex optimization algorithms through identification and control problems
