the processes of gemination lenition and vowel lengthening are central to the study of phonology as they reveal much about the treatment of quantity in a given language using data from older language stages modern dialects and standard languages this study examines the interdependence of vowel and consonant quantity in the history of the germanic branch of indo european kurt goblirsch focusses on the various geminations in old germanic languages west germanic gemination glide strengthening and expressive gemination open syllable lengthening in german dutch frisian english and scandinavian languages and the major lenitions in high german low german and danish as well as minor lenitions in bavarian franconian and frisian dialects all of these changes are related to the development of the germanic languages from distinctive segmental length to complementary length to syllable cut the discussion challenges traditional theoretical assumptions about quantity change in germanic languages to argue for a new account whereby gemination lenition and vowel lengthening are interrelated

data from a variety of languages are offered in support of the claim that although there are several processes by which languages commonly add to an already existing stock of long vowels there is only one mechanism by which a language without a distinction of vocalic length commonly introduces such a distinction this mechanism is the coalescence of vowel sequences typically after loss of intervocalic consonants this book examines vowels lengths their differences and their effects on language

this book investigates the phenomenon of morphological length manipulation changes in segmental length that cannot be explained by phonological means alone but crucially rely on morphological information eva zimmermann provides a unified theoretical account of these phenomena by taking into account all possible prosodically defective morpheme representations and their potential effects on the resulting surface structure data are drawn from a wide range of the world s languages including aymara yine upriver halkomelem wolof hungarian tohono o odham and southern sierra miwok providing a through representative database of morphological length manipulation patterns in the languages of the world the author demonstrates that alternative accounts suffer from significant problems of both under and over generation when tested against the full range of attested phenomena the volume will be of interest to all researchers and graduate students working in theoretical phonology and morphology

data from a variety of languages are offered in support of the claim that although there are several processes by which languages commonly add to an already existing stock of long vowels there is only one mechanism by which a language without a distinction of vocalic length commonly introduces such a distinction this mechanism is the coalescence of vowel sequences typically after loss of intervocalic consonants conversely it is argued that such coalescence always leads to the development of a length contrast unless the language is subject at the time of

coalescence to a rule distributing length as a function of some other variable typically stress development of a situation in which length is a function of stress is claimed equally to account for most cases of loss of a long established length contrast the chapter closes with a consideration of three cases in which surface contrasts of vowel length may be claimed to be the result of incipient phonologization of phonetically conditioned length
