philip s month by month stargazing 2016 is a concise guide to the northern hemisphere night

sky helping starwatchers to see the year's most fascinating events whether observing with the naked eye, binoculars or a telescope. New for 2016, the authors have included ideas for joining citizen science projects at the cutting edge of astronomical research. The guide is suitable for use between latitudes 40°N and 60°N, including Britain and Ireland, Europe as far south as Rome and Canada and the northern USA as far south as Philadelphia. Each chapter, one for each month of the year, has a colour star map created by Wil Tirion showing the positions and phases of the Moon, the positions of the planets and other useful information. Each month also includes a constellation described in detail, special events during the month such as eclipses, a featured astronomical object, usually a deep sky target, plus an astrophotograph with details of how it was taken. The solar system almanac explains the movement of the planets, with particular attention paid to their positions in 2016. Solar and lunar eclipses, meteor showers and comets are also described. Exploring the deep sky provides a list of recommended deep sky objects. The observer can use the monthly charts to discover which constellations are on view and then use this information to plan deep sky observing. The book concludes with an equipment review. Here Robin Scagell, author of *Philip's Stargazing with a Telescope*, provides a round up of what's new in observing technology.

Bright nebulae and star clusters along the Milky Way trace the spiral arms in the Sun's vicinity along our Milky Way galaxy's spiral arms in the neighborhood of the Sun and to how the brightest and how the eyepiece appearance of individual open clusters relates to their age and as a consequence galaxies are distributed with respect to our Milky Way to where they are with respect to the spiral arms.
