the william lowell putnam mathematics competition is the most prestigious undergraduate mathematics problem solving contest in north america with

thousands of students taking part every year this volume presents the contest problems for the years 2001 2016 the heart of the book is the solutions these include multiple approaches drawn from many sources plus insights into navigating from the problem statement to a solution there is also a section of hints to encourage readers to engage deeply with the problems before consulting the solutions the authors have a distinguished history of engagement with and preparation of students for the putnam and other mathematical competitions collectively they have been named putnam fellow top five finisher ten times kiran kedlaya also maintains the online putnam archive

this is the ninth book of problems and solutions from the american mathematics competitions amc contests it chronicles 325 problems from the thirteen amc 12 contests given in the years between 2001 and 2007 the authors were the joint directors of the amc 12 and the amc 10 competitions during that period the problems have all been edited to ensure that they conform to the current style of the amc 12 competitions graphs and figures have been redrawn to make them more consistent in form and style and the solutions to the problems have been both edited and supplemented a problem index at the back of the book classifies the problems into subject areas of algebra arithmetic complex numbers counting functions geometry graphs logarithms logic number theory polynomials probability sequences statistics and trigonometry a problem that uses a combination of these areas is listed multiple times the problems on these contests are posed by members of the mathematical community in the hope that all secondary school students will have an opportunity to participate in problem solving and an enriching mathematical experience

a collection of 400 math problems from moems contests from 2014 through 2018 these out of the box sometimes challenging problems are primarily aimed at students in grades four through eight but are suitable for all students to improve problem solving skills all contests have answers complete solutions most with multiple solution paths and follow up questions to delve deeper into a particular topic

this third volume of problems from the william lowell putnam competition is unlike the previous two in that it places the problems in the context of important mathematical themes the authors highlight connections to other problems to the curriculum and to more advanced topics the best problems contain kernels of sophisticated ideas related to important current research and yet the problems are accessible to undergraduates the solutions have been compiled from the american mathematical monthly mathematics magazine and past competitors multiple solutions enhance the understanding

of the audience explaining techniques that have relevance to more than the problem at hand in addition the book contains suggestions for further reading a hint to each problem separate from the full solution and background information about the competition the book will appeal to students teachers professors and indeed anyone interested in problem solving as a gateway to a deep understanding of mathematics
