big data thrives on extracting knowledge from a large number of data sets but how is an application possible when a single data set is several gigabytes in size the innovative data compression techniques from the field of machine learning and modeling using bayesian networks which have been theoretically developed and practically implemented here can reduce these huge amounts of data to a manageable size by eliminating redundancies in location time and between simulation results data reductions to less than 1 of the original size are possible the developed method represents a promising approach whose use goes far beyond the application example of crash test simulations chosen here
