as an area of statistical application environmental epidemiology and more speci cally the estimation of health risk associated with the exposure to vironmental agents has led to the development of several statistical methods and software that can then be applied to other scienti c areas the stat tical analyses aimed at addressing questions in environmental epidemiology have the following characteristics often the signal to noise ratio in the data is low and the targets of inference are inherently small risks these constraints typically lead to the development and use of more sophisticated and pot tially less transparent statistical models and the integration of large hi dimensional databases new technologies and the widespread availability of powerful computing are also adding to the complexities of scienti c inves gation by allowing researchers to t large numbers of models and search over many sets of variables as the number of variables measured increases so do the degrees of freedom for in uencing the association between a risk factor and an outcome of interest we have written this book in part to describe our experiences developing and

applying statistical methods for the estimation for air pollution health e ects our experience has convinced us that the application of modern s tistical methodology in a reproducible manner can bring to bear subst tial bene ts to policy makers and scientists in this area we believe that the methods described in this book are applicable to other areas of environmental epidemiology particularly those areas involving spatial temporal exposures
