surveys the theoretical results on systems of nonlinear equations in finite dimension and the major iterative methods for their computational solution offers a research level presentation of the principal results known in 1970 the results and proof techniques introduced still represent a solid basis for this topic

serving both as an introduction to the subject and as a reference this book presents the theory in elegant form and with modern concepts and notation it covers the general theory and emphasizes the classical types of orthogonal polynomials whose weight functions are supported on standard domains the approach is a blend of classical analysis and symmetry group theoretic methods finite reflection groups are used to motivate and classify symmetries of weight functions and the associated polynomials this revised edition has been updated throughout to reflect recent developments in the field it contains 25 new material including two brand new chapters on orthogonal polynomials in two variables which will be especially useful for applications and orthogonal polynomials on the unit sphere the most modern and complete treatment of the subject available it will be useful to a wide audience of mathematicians and applied scientists including physicists chemists and engineers

the aim of this book is to lead the reader out from the ordinary routine of computing and calculating by engaging in a more dynamic process of learning this learning by doing approach can be traced back to aristotle who wrote in his nicomachean ethics that for the things we have to learn before we can do them we learn by doing them the theory is illustrated through many relevant examples followed by a large number of exercises whose requirements are rendered by action verbs find show verify check and construct readers are compelled to analyze and organize analytical skills rather than placing the exercises in bulk at the end of each chapter sets of practice questions after each theoretical concept are included the reader has the possibility to check their understanding work on the new topics and gain confidence during the learning activity as the theory unfolds the exercises become more complex sometimes they span over several topics hints have been added in order to guide the reader in the process this book stems from the differential calculus course which the author taught for many years the goal of this book is to immerse the reader in the subtleties of differential calculus through an active perspective particular attention was paid to continuity and differentiability topics presented in a new course of action

this book illustrates the basic ideas of regularity properties of functional equations by simple examples it then treats most of the modern results about regularity of non composite functional equations of several variables in a unified fashion a long introduction highlights the basic ideas for beginners and several applications are also included

computer science and applied mathematics iterative solution of nonlinear equations in several variables presents a survey of the basic theoretical results about nonlinear equations in  $n$  dimensions and analysis of the major iterative methods for their numerical solution this book discusses the gradient mappings and minimization contractions and the continuation property and degree of a mapping the general iterative and minimization methods rates of convergence and one step stationary and multistep methods are also elaborated this text likewise covers the contractions and nonlinear majorants convergence under partial ordering and convergence of minimization methods this publication is a good reference for specialists and readers with an extensive functional analysis background

description of the product 100 updated as per latest textbook issued by ncert crisp revision with concept wise revision notes mind maps and mnemonics visual learning aids with theoretical concepts and concept videos complete question coverage with all intext questions and exercise questions fully solved
