the nonlinear theory of oscillating systems has introduced new aspects to the study of variable stars beyond the comparison of linear periods and the estimate of stability the appearance and disappearance of possible models can be studied in detail while nonlinearity in stellar pulsations is not a very complicated concept it generally requires extensive and sometimes sophisticated numerical studies the development of appropriate computational tools has allowed us to apply the nonlinear theory to real phenomena in variable stars the international astronomical union colloquium no 134 presents a review of the new frontiers of variable star studies one which will encourage further development of this field

the use of laser pulses to alter the internal quantum structure of individual atoms and molecules has applications in quantum information processing the coherent control of chemical reactions and in quantum state engineering this book presents the underlying theory of such quantum state manipulation for researchers and graduate students the book provides the equations and approaches for their solution which can be applied to complicated multilevel quantum systems it also gives the background theory for application to isolated atoms or trapped ions simple molecules and atoms embedded in solids particular attention is given to the ways in which quantum changes can be displayed graphically to help readers understand how quantum changes can be controlled

this textbook offers a modern approach to the physics of stars assuming only undergraduate level preparation in mathematics

and physics and minimal prior knowledge of astronomy it starts with a concise review of introductory concepts in astronomy before covering the nuclear processes and energy transport in stellar interiors and stellar evolution from star formation to the common stellar endpoints as white dwarfs and neutron stars in addition to the standard material the author also discusses more contemporary topics that students will find engaging such as neutrino oscillations and the msw resonance supernovae gamma ray bursts advanced nucleosynthesis neutron stars black holes cosmology and gravitational waves with hundreds of worked examples explanatory boxes and problems with solutions this textbook provides a solid foundation for learning either in a classroom setting or through self study

the page grassland ecosystems focuses on a selected set of grassland goods and services food forage and livestock biodiversity carbon storage and tourism and recreation each good or service is discussed in terms of its current status and modifications that have altered its condition such as cultivation urbanization fire livestock grazing and introduction of invasive species results show that although the major goods and services provided by grasslands are in good to fair condition the capacity for grassland ecosystems to continue to provide these goods and services is declining there have been unambiguous declines in the extent of grasslands especially in the temperate zones of north america and europe where these ecosystems have been cultivated or urbanized indicators of soil condition show that more than half of the grasslands in the study have some degree of soil degradation over 5 percent of these grasslands are strongly to extremely degraded indicators of grassland biodiversity show marked declines in grassland birds of north america with negative effects from fragmentation and non native species suggested for this region and others although the carbon storage potential for grasslands is large degraded areas store less carbon and there is heavy burning of some grassland areas especially the african savannas tourism and recreational activities in grasslands appear to make important economic contributions to some countries with revenues generally increasing overuse of some areas and declines in wildlife populations however suggest possible declines in the capacity to continue to provide these services
