this volume comprises the first part of the proceedings of the 10th international conference on finite volumes for complex applications fvca held in strasbourg france during october 30 to november 3 2023 the finite volume method and several of its variants is a spatial discretization technique for partial differential equations based on the fundamental physical principle of conservation recent decades have brought significant success in the theoretical understanding of the method many finite volume methods are also built to preserve some properties of the continuous equations including maximum principles dissipativity monotone decay of the free energy asymptotic stability or stationary solutions due to these properties finite volume methods belong to the wider class of compatible discretization methods which preserve qualitative properties of continuous problems at the discrete level this structural approach to the discretization of partial differential equations becomes particularly important for multiphysics and multiscale applications in recent years the efficient implementation of these methods in numerical software packages more specifically to be used in supercomputers has drawn some attention this volume contains all invited papers as well as the contributed papers focusing on finite volume schemes for elliptic and parabolic problems they include structure preserving schemes convergence proofs and error estimates for problems governed by elliptic and parabolic partial differential equations the second volume is focused on finite volume methods for hyperbolic and related problems such as methods compatible with the low mach number limit or able to exactly preserve steady solutions the development and analysis of high order methods or the discretization of kinetic equations
