the color photographs and illustrations appearing in select monographs over the past decade represent a significant advance in surgical communication previously black and white renderings were standard because color printing had not been perfected and its cost was prohibitive we believe the gradual change from black and white etchings and reproductions to detailed color illustrations represents a tremendous twentieth century achievement in our own urologic practices it became evident that the use of black and white sketches for teaching operative urology while helpful left too much to the surgeon's imagination even the dimension of depth produced by varying the intensity of shading often was inadequate in demonstrating subtle surgical details in a fossa or bed since color photography recently has been used to demonstrate operative techniques we climbed on the bandwagon and photographed in color many of the major operative procedures however the reflection of light caused by normal tissue fluid significantly reduces the clarity of photographs not infrequently the crucial operative step is obscured by light reflected on a trickle of blood even when meticulous care is taken to irrigate and clean the surgical field the tissue sheen obscures portions of the field color paintings by a gifted artist are not only unique but can be extraordinary the vividness with which subtleties can thus be portrayed cannot be matched by photography black and white or color
