we are poised to embark on a new era of discovery in the study of geomorphology the discipline has a long and illustrious history but in recent years an entirely new way of studying landscapes and seascapes has been developed it involves the use of 3d seismic data just as cat scans allow medical staff to view our anatomy in 3d seismic data now allows earth scientists to do what the early geomorphologists could only dream of view tens and hundreds of square kilometres of the earth s subsurface in 3d and therefore see for the first time how landscapes have evolved through time this volume demonstrates how earth scientists are starting to use this relatively new tool to study the dynamic evolution of a range of sedimentary environments

sedimentology and stratigraphy are covered in unprecedented depth in this updated and dynamic follow up to principles of sedimentology regarded since its publication in 1978 as the definitive text

in the field suitable for advanced undergraduate and graduate students this new text encompasses a contemporary global view of sedimentary deposits the most recent data on such increasingly important topics as seismic stratigraphy and sequence stratigraphy process sedimentology facies patterns extraterrestrial forcing functions basin analysis and plate tectonics are explored the text s structure and organization accommodate a complete treatment of both sedimentology and stratigraphy and presents them in a historical context
