it's time to rewrite the rules to curb the runaway flow of wealth to the top one percent to restore security and opportunity for the middle class and to foster stronger growth rooted in broadly shared prosperity inequality is a choice the united states bills itself as the land of opportunity a place where anyone can achieve success and a better life through hard work and determination but the facts tell a different story the u.s. today lags behind most other developed nations in measures of inequality and economic mobility for decades wages have stagnated for the majority of workers while economic gains have disproportionately gone to the top one percent education housing and health care essential ingredients for individual success are growing ever more

expensive deeply rooted structural discrimination continues to hold down women and people of color and more than one fifth of all american children now live in poverty these trends are on track to become even worse in the future some economists claim that today s bleak conditions are inevitable consequences of market outcomes globalization and technological progress if we want greater equality they argue we have to sacrifice growth this is simply not true american inequality is the result of misguided structural rules that actually constrict economic growth we have stripped away worker protections and family support systems created a tax system that rewards short term gains over long term investment offered a de facto public safety net to too big to fail financial institutions and chosen monetary and fiscal policies that promote wealth over full employment

a small interview survey was undertaken to see how actual wage setters would react to the central ideas of several economic theories of wage stickiness wage cuts were surprisingly prevalent in recent years despite the booming economy the strongest finding was that managers believe that perceptions of fairness play a major motivational role in labor markets and that a fair wage policy is a good deal more complicated than simply not cutting wages we also found substantial evidence for money illusion and against the adverse selection version of the efficiency wage model

this paper presents a two country extension of lucas 1988 work on the effects of cash in advance constraints in asset markets on the pricing of financial assets the model is one where there exists some degree of separation between the goods markets and the asset markets and money is used for transactions in both markets the main results of the paper are the following first the equilibrium level of the exchange rate depends on the share of money used for asset transactions a greater share will correspond to a more appreciated exchange rate second under uncertainty liquidity effects deriving from stochastic shocks to bond creation lead to an excess volatility of nominal and real exchange rates even when the fundamental value of the exchange rate is constant third capital controls in the form of taxes on foreign asset acquisitions tend to appreciate the exchange rate fourth the maturity structure of the public debt affects the equilibrium exchange rate in particular a move towards a longer maturity structure will tend to depreciate the exchange rate

this paper studies the transmission of fiscal disturbances between countries and the effect of those disturbances on worldwide capital intensity in a context of growth the model developed to address these issues allows for the production of both nontradable and relatively capital intensive tradable goods a central finding is that factor markets can be a major channel for the communication of fiscal policy shocks to world interest rates to private saving decisions and ultimately to global asset supplies and their distribution among countries particular predictions of the model illustrate how changes in public debt ratios and shifts in government spending patterns affect resource allocation and welfare for example an increase in a small country s per capita public debt leads to long

run crowding in of capital and the impoverishment of future generations a similar policy shift by a large country crowds out capital on a global scale impoverishes future domestic generations and has ambiguous effects abroad

in this paper i outline and test a simple theory that describes the evolution of expectations concerning social security benefits during the pre retirement period after correcting for the presences of measurement error i obtain results that are consistent with this theory expectations appear to evolve as a random walk and innovations in this process are unrelated to previously available information i also estimate responses of expectations to the arrival of new information although previous research indicates that individuals do not form expectations on the basis of all available information and in particular ignore much of the information contained in concurrent statutory entitlements to social security benefits responses to new information during the period immediately preceding retirement appear to be highly rational the bulk of information affects the evolution of expectations only through its impact on actual benefit calculations furthermore the data support the view that individuals form accurate assessments of the ultimate impact of new information on actual benefits

patterns in domestic credit creation stemming from inconsistent fiscal policies have received widespread attention for aggravating speculative attacks on central bank foreign exchange reserves and contributing to the collapse of exchange rate regimes this paper acknowledges the importance of monetary and fiscal discipline but also emphasizes the importance of other random shocks to the domestic money market most notably shocks from external credit supplies and relative prices policies of the domestic fiscal authorities are only partial catalysts for speculative attacks on a currency expansion of domestic credit stemming from the monetization of fiscal imbalances may be dominated by involuntary domestic credit expansions necessitated by surprise shortages in supplies of external capital further the unexpected availability of external capital translates into a lower net critical reserve floor making the depletion of central bank reserves by a speculative attack more difficult to accomplish also of considerable importance are relative price shocks which directly influence the probability of collapse by randomizing the demand for nominal money balances empirical studies of exchange rate crises that neglect these considerations will produce biased estimates of both expected collapse probabilities and anticipated post collapse exchange rates

this paper analyzes the effects of government intervention in credit markets when lenders use collateral interest and the probability of granting a loan as potential screening devices equilibria with and without rationing are examined the principal theme is that credit policies operate through their effect on the incentive compatibility constraint which inhibits high risk borrowers from mimicking the behavior of low risk borrowers any policy that loosens tightens the constraint raises reduces efficiency most government credit programs explicitly attempt to fund investors that cannot obtain private financing in the model

presented here these subsidies increase the extent of rationing and reduce efficiency in contrast policies that subsidize the nonrationed borrowers or all borrowers are efficiency enhancing and reduce the extent of rationing

this paper questions recent conclusions that the trend towards defined contribution plans and away from defined benefit plans is due to increased pension regulation and or a changing economic environment using data from irs 5500 filings by pension administrators we find that at least half of the trend is due to a shifting employment mix toward firms with industry size and union status characteristics which have historically been associated with lower defined benefit plan rates not more than half of the trend can be attributed to a stampede by firms with given industry size and union status characteristics toward defined contribution pension coverage

this paper uses current population survey data on a large sample of workers to estimate the determinants of participation in state workers compensation programs in the united states the principal finding is that higher workers compensation benefits are associated with greater participation in the workers compensation program after accounting for worker characteristics state fixed effects and other aspects of the workers compensation law moreover this result holds for both manufacturing and non manufacturing workers workers compensation benefits however have an insignificant effect on program participation for the sample of women overall a 10 increase in benefits is associated with a 6.7 increase in program participation in addition the results show that the waiting period that is required before benefit payments begin has a substantial negative effect on participation in the workers compensation program finally the parameters of the cross sectional model are used to simulate the aggregate workers compensation incidence rate from 1969 to 1987 the growth in workers compensation claims in the 1970s appears to correspond reasonably well to the growth in real benefits that occurred during this time period

this paper investigates how job creation and destruction behavior varies by employer size in the u s manufacturing sector during the period 1972 to 1988 the paper also evaluates the empirical basis for conventional claims about the job creating prowess of small businesses the chief findings and conclusions fall into five categories 1 conventional wisdom about the job creating prowess of small businesses rests on misleading interpretations of the data 2 many previous studies of the job creation process rely upon data that are not suitable for drawing inferences about the relationship between employer size and job creation 3 large plants and firms account for most newly created and newly destroyed manufacturing jobs 4 survival rates for new and existing manufacturing jobs increase sharply with employer size 5 smaller manufacturing firms and plants exhibit sharply higher gross rates of job creation but not higher net rates

this paper offers some observations on employee crime economic theories of crime limits on bonding and the efficiency wage hypothesis we demonstrate that the simplest economic theories of crime predict that profit maximizing firms should follow strategies of minimal monitoring and large penalties for employee crime finding overwhelming empirical evidence that firms expend considerable resources trying to detect employee malfeasance and do not impose extremely large penalties we investigate a number of possible reasons why the simple model s predictions fail it turns out that plausible explanations for firms large outlays on monitoring of employees also justify the payment of premium wages in some circumstances there is no legitimate a priori argument that firms should not pay efficiency wages once it is recognized that they expend significant resources on monitoring

empirical tests of the life cycle model have focused on its implications for the level of a household s total net worth and paid little attention to changes in portfolio composition over the life cycle in this paper we examine a new survey of the asset holdings of 6 010 u s households and show that there is a pronounced life cycle pattern to both the number and value of assets held by u s households direct survey evidence suggests that incomplete information is a significant determinant of household portfolio composition we test the hypothesis that information about investment opportunities arrives stochastically over time estimating a poisson model for the arrival of new information
