this compendium was produced as part of a study contract led by the commission of the european communities directorate general for science research and development ref no pss 0310 it contains a comprehensive overview of problematic situations which are commonly discussed in the standard literature on biomedical ethics as analysed by the international forum for biophilosophy the purpose of the study contract was to establish an analytical inventory of possible ethical problems linked to modern biomedical research and of the involved leading scientists and research centres in the european community the latter part of the study objective is reported in a separate complementary volume the repertoire which presents information following a questionnaire from experts who have professional leading functions relevant to advanced biomedical research confronted with ethical questions both volumes should be regarded as a first step towards a reference source potentially helpful to objectify the present concern and discussion about the fast progress of modern biomedical science and technology the two volumes are therefore conceived as living documents for practical use which do not pretend to be exhaustive but which invite all competent european researchers to complete them in due course and to share the information they have this will make future updates increasingly more effective the reader of this book will easily discover that most questions and issues mentioned in this volume are in fact particular appearances or embodiments of deeper questions like what is really the good society we can aim at now what is the good personal well being we should promote in those circumstances what does it mean to us to make good use of and develop a good attitude towards nature its potential problems and its resources what are the good things for us to aspire to now how exactly can health care contribute to the realization of those goals and how exactly can developments in biology or medicine improve the quality of those goals or the effectiveness to reach them

new developments in the area of biomedicine give rise to difficult ethical questions and sometimes also to intense discussions reference is often made to the notion of human dignity but it is seldom clear how this notion is to be understood what does the notion imply with regard to unborn human beings does the notion of a distinctive human dignity allow us to ignore the interests of animals in this study ethical problems related to prenatal diagnosis embryo research transplantation of foetal tissue certain methods of assisted reproduction and genetic intervention in human and animal life are analyzed treat humanity merely as a means but always also as an end from this and other principles kant derived the duties of respect and beneficence these principles and duties are necessary but not sufficient in order to arrive at conclusions in ethics we need additional moral competence in order to assess the morally relevant facts in this study kant s distinction between determinant and reflective judgement is used in order to give a complete exposition of his ethical system theories available to us in discussing ethical problems related to biomedical research and clinical practice the conclusion of the study is that the kantian account provides a fruitful ethical approach which gives differentiated answers to the different questions

these notes are based on a series of lectures that I gave at the 14th biennial seminar of the Canadian Mathematical Congress held at the University of Western Ontario August 12-24 1973 and in some of my lectures in a modeling course that I have cotaught in the Division of Bio Medical Sciences at Brown during the past several years an earlier version of these notes appeared in the Center for Dynamical Systems Lectures Notes Series CDS in 1973. In November 1973 I have in this revised and extended version of those earlier notes incorporated a number of changes based both on classroom experience and on my research efforts with several colleagues during the intervening period. The narrow viewpoint of the present notes use of optimization and control theory in biomedical problems reflects more the scope of the CMC lectures given in August 1973 than the scope of my own interests indeed my real interests have included the modeling process itself as well as the contributions made by investigators who employ the techniques and ideas of control theory. Systems analysis, differential equations and stochastic processes some of these contributions have quite naturally involved application of optimal control theory but in my opinion many of the interesting efforts being made in modeling in the biomedical sciences encompass much more than the use of control theory.
