this book presents a unified algebraic approach to stabilization problems of linear boundary control systems with no assumption on finite dimensional approximations to the original systems such as the existence of the associated riesz basis a new proof of the stabilization result for linear systems of finite dimension is also presented leading to an explicit design of the feedback scheme the problem of output stabilization is discussed and some interesting results are developed when the observability or the controllability conditions are not satisfied

proportional optimization and fairness is a long needed attempt to reconcile optimization with apportionment in just in time jit sequences and find the common ground in solving problems ranging from sequencing mixed model just in time assembly lines through just in time batch production balancing workloads in event graphs to bandwidth allocation internet gateways and resource allocation in computer operating systems the book argues that apportionment theory and optimization based on deviation functions provide natural benchmarks for a process and then looks at the recent research and developments in the field individual chapters look at the theory of apportionment and just in time sequences minimization of just in time sequence deviation optimality of cyclic sequences and the oneness bottleneck minimization competition free instances fraenkel s conjecture and optimal admission sequences response time variability applications to the liu layland problem and pinwheel scheduling temporal capacity constraints and supply chain balancing fair queuing and stride scheduling and smoothing and batching

this book introduces readers to the fundamentals of transportation problems under the fuzzy environment and its extensions it also discusses the limitations and drawbacks of 1 recently proposed aggregation operators under the fuzzy environment and its various extensions 2 recently proposed methods for solving transportation problems under the fuzzy environment and 3 recently proposed methods for solving transportation problems under the intuitionistic fuzzy environment in turn the book proposes simplified methods to overcome these limitations

reliably optimizing a new treatment in humans is a critical first step in clinical evaluation since choosing a suboptimal dose or schedule may lead to failure in later trials at the same time if promising preclinical results do not translate into a real treatment advance it is important to determine this quickly and terminate the clinical evaluation process to avoid wasting resources bayesian designs for phase i ii clinical trials describes how phase i ii designs can serve as a bridge or protective barrier between preclinical studies and large confirmatory clinical trials it illustrates many of the severe drawbacks with conventional methods used for early phase clinical trials and presents numerous bayesian designs for human clinical trials of new experimental treatment regimes written by research leaders from the university of texas md anderson cancer center this book shows how bayesian designs for early phase clinical trials can explore refine and optimize new experimental treatments it emphasizes the importance of basing decisions on both efficacy and toxicity
