this book provides an excellent reference guide to basic theoretical arguments practical quantitative techniques and the methodologies that the majority of social science researchers are likely to require for postgraduate study and beyond diagrams and tables are used effectively throughout the text and snippets of sample code provide useful additions to chapters for those of us who are less familiar with statistical software packages where equations are used to they are explained and documented with careful explanation of statistical notation each of the chapters in the book references a representative range of key authors and seminal texts making it an ideal springboard for further and more advanced reading the book

provides an excellent reference of quantitative methodology and would provide a very useful addition to the shelves of researches and university libraries environment and planning this is a book that will rapidly be recognized as the bible for social researchers it provides a first class reliable guide to the basic issues in data analysis such as the construction of variables the characterization of distributions and the notions of inference scholars and students can turn to it for teaching and applied needs with confidence however the book also seeks to enhance debate in the field by tackling more advanced topics such as models of change causality panel models and network analysis specialists will find much food for thought in these chapters a distinctive feature of the book is the breadth of coverage no other book provides a better one stop survey of the field of data analysis in 30 specially commissioned chapters the editors aim to encourage readers to develop an appreciation of the range of analytic options available so they can choose a research problem and then develop a suitable approach to data analysis the book provides researchers with guidance in and examples of both quantitative and qualitative modes of analysis written by leading practitioners in the field the editors give a persuasive account of the commonalities of purpose that exist across both modes as well as demonstrating a keen awareness of the different things that each offers the practising researcher clive seale brunel university with the appearance of this handbook data analysts no longer have to consult dozens of disparate publications to carry out their work the essential tools for an intelligent telling of the data story are offered here in thirty chapters written by recognized experts while quantitative methods are treated from basic statistics through the general linear model and beyond qualitative methods are by no means neglected indeed a unique feature of this volume is the careful integration of quantitative and qualitative approaches undoubtedly this integration succeeds because of the research strengths of the editors leading social researchers who themselves employ both quantitative and qualitative methods michael lewis beck f wendell miller distinguished professor of political science university of iowa and editor of the sage quantitative applications in the social sciences series this is an excellent guide to current issues in the analysis of social science data i recommend it to anyone who is looking for authoritative introductions to the state of the art each chapter offers a comprehensive review and an extensive bibliography and will be invaluable to researchers wanting to update themselves about modern developments professor nigel gilbert pro vice chancellor and professor of sociology university of surrey

while exposure to data has become more or less a daily ritual for the rank and file knowledge worker true understanding treated in this book as data literacy resides in knowing what lies behind the data everything from the data s source to the specific choice of input variables algorithmic transformations and visual representation shape the accuracy relevance and value of the data and mark its journey from raw data to

the first part of this book is devoted to methods seeking relevant dimensions of data the variables thus obtained provide a synthetic description which often results in a graphical representation of the data after a general presentation of the discriminating analysis the second part is devoted to clustering methods which

1 1 typical problems of data analysis every branch of experimental science after passing through an early stage of qualitative description concerns itself with quantitative studies of the phenomena of interest i e measurements in addition to designing and carrying out the experiment an important task is the accurate evaluation and complete exploitation of the data obtained let us list a few typical problems 1 a study is made of the weight of laboratory animals under the influence of various drugs after the application of drug a to 25 animals an average increase of 5 is observed drug b used on 10 animals yields a 3 increase is drug a more effective the averages 5 and 3 give practically no answer to this question since the lower value may have been caused by a single animal that lost weight for some unrelated reason one must therefore study the distribution of individual weights and their spread around the average value moreover one has to decide whether the number of test animals used will enable one to differentiate with a certain accuracy between the effects of the two drugs 2 in experiments on crystal growth it is essential to maintain exactly the ratios of the different components from a total of 500 crystals a sample of 20 is selected and analyzed
